

Abu hafiz SuperMarket Rewards

Input file: **standard input**
Output file: **standard output**
Time limit: 1 second
Memory limit: 256 megabytes

Abu hafiz supermarket is having a special sale.

Each customer is assigned a loyalty card with a unique ID. Every time a customer makes a purchase during the sale, their card ID is recorded.

Sometimes, a customer makes multiple purchases, so their ID may appear multiple times in the records.

The supermarket wants to give a reward to customers based on their loyalty card ID — each customer's contribution to the reward equals the value of their ID. However, a customer can only contribute once, regardless of how many times they shopped.

Your task is to calculate the total amount of rewards **Abu Hafiz** will give for his customers.

Input

The input consists of two lines:

- first line contains one integer N ($1 \leq N \leq 10^5$) the number of scans the customers made.
- the second line contains N integers $A_i, A_{i+1}, \dots, A_{i+N}$ ($1 \leq A_i \leq 10^5$) the id's of the customers in each scan.

Output

Output a single integer contains the sum of the whole rewards that the supermarket will give.

Example

standard input	standard output
5 2 3 1 2 5	11
