

Late Taxes

Input file: **standard input**
Output file: **standard output**
Time limit: 1 second
Memory limit: 256 megabytes

In Level 2 training, many students started coming late. Mohammed and Rand were not happy. They had a discussion and made a decision:

Any student who comes late must pay **20 dinars** as a tax.

The students became angry. They said it is not fair. They said the traffic is bad. They said the alarm did not ring. After more discussion, the coaches made the final decision:

The rule stays. But Tareq will pay all the taxes for the late students. Tareq did not agree, but the decision was final.

You are given the starting time and the student's arrival time. A student is considered **late** if his arrival time is strictly after the starting time.

Your task is to print the total amount of money Tareq must pay.

Input

The first line contains two integers n and t ($1000 \leq n, t \leq 2000$).

The second line contains n integers $t_1, t_2, \dots, t_n$ ($1 \leq t_i \leq 3000$) .

Output

Print one integer — the total amount of money Tareq must pay.

Example

standard input	standard output
5 7 7 1 4 8 9	40
